

PRECURSOR CATHODE ACTIVE MATERIAL (pCAM)

Market Research Report

Author: Brendan Jephcott

Date: September 2024

Table of Contents

Executive Summary	2
1.0 Introduction.....	8
2.0 Product Characteristics and Specifications.....	10
3.0 Principal Production Methods.....	13
3.1 Raw Material Requirements.....	19
3.2 Processing Parameters which affect pCAM Production.....	25
3.2.1 Ammonia Concentration.....	27
3.2.2 pH Value.....	30
3.2.3 Reaction Temperature.....	33
3.3.4 Reaction Control of pCAM of Different Components.....	36
3.3.5 Reaction Time and Reaction Atmosphere.....	36
3.3.6 Other Variables Affecting the pCAM Reaction Process.....	38
3.4 pCAM Production Equipment.....	45
3.4.1 Reactor.....	48
3.4.2 Filtration and Washing Equipment.....	49
3.4.3 Drying Equipment.....	52
3.5 Future Production Process R&D Trends.....	55
4.0 Cash Cost Analysis.....	61
5.0 Commercialisation.....	68
5.1 Rise of pCAM Production.....	68
5.2 Market Size Potential.....	73
6.0 Competitive Landscape.....	74
6.1 CNGR Advanced Material Co., Ltd.....	78
6.2 GEM Co., Ltd.....	94
6.3 Zhejiang Huayou Cobalt Co., Ltd.....	106
6.4 Guangdong Brunp Recycling Technology Co., Ltd.....	117
6.4 Lanzhou Jintong Energy Storage Power New Materials Co., Ltd.....	119
6.6 Overseas pCAM Companies.....	121
References.....	129
Appendix: 50,000tpa Ternary pCAM — Case Example.....	132
Disclaimer.....	173

Figures

Figure 1: Working principle of a lithium-ion battery	8
Figure 2: Lithium-ion battery packing types	8
Figure 3: pCAM is located within the lithium-ion battery midstream industry chain	9
Figure 4: pCAM is a black powder (illustrative).....	9
Figure 5: pCAM SEM image (illustrative).....	9
Figure 6: pCAM co-precipitation principal processing flowsheet.....	14
Figure 7: Continuous method principal processing flowsheet to produce pCAM.....	18
Figure 8: Nickel sulfate hexahydrate (illustrative)	19
Figure 9: Cobalt sulfate heptahydrate (illustrative)	20
Figure 10: Manganese sulfate monohydrate (illustrative).....	21
Figure 11: Sodium hydroxide (illustrative)	22
Figure 12: Liquid ammonia solution (illustrative).....	22
Figure 13: Comparison of electrochemical performance of large and small particle cathode materials	24
Figure 14: The specific surface area of the pCAM directly affects the crystal form, capacity and rate performance of the cathode material	25
Figure 15: Process parameters that affect the physical and chemical properties of the pCAM.....	26
Figure 16: High nickel pCAM with different ammonia concentrations (left: 2g/L and right: 7g/L)	27
Figure 17: Increasing ammonia concentration leads to a decrease in nickel content.....	28
Figure 18: Effect of ammonia concentration on pCAM, cathode and lithium-ion battery performance	29
Figure 19: Ammonia concentration and pH value of pCAM of different components.....	30
Figure 20: PCAM morphologies obtained by reaction at different pH.....	30
Figure 21: SEM of primary particles with different morphologies agglomerated into secondary particles....	31
Figure 22: Influence of pH value on the performance of pCAM, cathode and lithium-ion battery	32
Figure 23: At low temperature, the primary particles are small and dense, and at high temperature, the primary particles are coarse (50 degrees on the left and 60 degrees on the right).....	33
Figure 24: Temperature influence on pCAM, cathode and lithium-ion battery performance.....	35
Figure 25: High nickel pCAM require higher pH and ammonia concentrations.....	36
Figure 26: Tap density gradually increases with the increase of reaction time.....	37
Figure 27: NCM pCAM without nitrogen protection presents agglomerates of different sizes.....	37
Figure 28: Increasing solid content makes pCAM morphology more regular and the surface of the secondary particles more dense (left: 10%, and right: 20%).....	38
Figure 29: Effect of solid content on pCAM, cathode and lithium-ion battery performance	39
Figure 30: Relationship between stirring speed and tap density	40
Figure 31: The lower the stirring speed, the larger the size of the pCAM secondary particles.....	41
Figure 32: Effect of stirring speed on pCAM, cathode, and lithium-ion battery performance.....	42
Figure 33: Effect of the liquid on the morphology of the high-nickel pCAM, the precipitation time is 36h. (Left: oil content is 9.5ppm, right: oil content is 2ppm)	43
Figure 34: Temperature control process.....	44
Figure 35: Split-range temperature control method.....	45
Figure 36: pCAM production equipment investment structure	45
Figure 37: Schematic diagram of pCAM production line (intermittent method as an example)	47
Figure 38: Schematic diagram of the pCAM reactors 1 and 2.....	48
Figure 39: Filter press	49
Figure 40: Working principal diagram of centrifuge	49
Figure 41: Microporous filter.....	50
Figure 42: Filter-wash two-in-one equipment	50
Figure 43: Hot air circulation oven	52
Figure 44: Working principal diagram of hot air circulation oven	52
Figure 45: Disc dryer (left) and working principal of disc dryer (right)	53
Figure 46: Working principal diagram of rotary drum dryer	53
Figure 47: Flash dryer.....	54
Figure 48: Working principal diagram of flash dryer	54
Figure 49: Ordinary polycrystalline/secondary spherical cathode material	56

Figure 50: Single crystal cathode material.....	57
Figure 51: Schematic diagram of lithium-ion battery self-discharge caused by magnetic foreign matter ...	58
Figure 52: Schematic diagram of core-shell pCAM and ternary cathode structure.....	59
Figure 53: Schematic diagram of gradient structure pCAM	59
Figure 54: Schematic diagram of radial ternary pCAM structure	60
Figure 55: Ternary power battery cost structure (taking the NCM523 battery cell as an example).....	61
